## Homework 3

## (Total 170 pts)

Due 5:00 pm on July 17, 2024 (Wednesday)
Note: Submit two files ('hw3.pdf' and 'q6.m') on Canvas.

1. (20 pts) The continuous-time signal $x_{c}(t)=\sin (20 \pi t)+\cos (40 \pi t)$ is sampled with a sampling period $T$ to obtain the discrete-time signal

$$
x[n]=\sin \left(\frac{\pi n}{5}\right)+\cos \left(\frac{2 \pi n}{5}\right) .
$$

Determine if the following sampling periods will allow us to convert $x_{c}(t)$ into $x[n]$ :
(a) $T=0.01$
(b) $T=0.11$
2. (30 pts)

Consider the system shown below for processing of the input bandlimited continuous-time waveform $x_{c}(t)$.

Find the continuous-time frequency response $H_{c}(j \Omega)$, given that
(a) $\quad x_{c}(t)$ is bandlimited to $|\Omega|<\Omega_{M}$.
(b) The C/D converter has sampling rate $T=\frac{\pi}{\Omega_{M}}$, and produces the signal $x_{d}[n]=x_{c}(n T)$.
(c) The discrete-time filter has frequency response $H_{d}\left(e^{j \omega}\right)=\frac{e^{\frac{j \omega}{2}}-e^{-\frac{j \omega}{2}}}{T}, \quad|\omega| \leq \pi$.
(d) The ideal D/C converter is such that $y_{d}[n]=y_{c}(n T)$.
3. (20 pts) Consider the system shown below. For the input signals $x[n]=\frac{\sin \left(\frac{\pi n}{4}\right)}{\pi n}$. Determine whether the output $x_{r}[n]=x[n]$. Justify your answer.

4. (40 pts) Consider the discrete-time system shown below

Assume that $L=2$ and $M=4$, and that $X\left(e^{j \omega}\right)$, the DTFT of $x[n]$, is real and is as shown below.

And

$$
H\left(e^{j \omega}\right)=\left\{\begin{array}{cc}
M & |\omega| \leq \frac{\pi}{4} \\
0 & \frac{\pi}{4}<|\omega| \leq \pi
\end{array}\right.
$$

Sketch $X_{e}\left(e^{j \omega}\right), Y_{e}\left(e^{j \omega}\right), Y\left(e^{j \omega}\right)$, the DTFTs of $x_{e}[n], y_{e}[n], y[n]$, respectively. Be sure to clearly label salient amplitudes and frequencies.
5. ( 20 pts ) Consider the decimation filter bank shown below in the left. The filter bank can also be implemented as shown below in the right.

Assume that $y_{0}[n]$ and $y_{1}[n]$ are generated according to the following difference equations:

$$
\begin{aligned}
& y_{0}[n]=\frac{1}{4} y_{0}[n-1]-\frac{1}{3} x_{0}[n]+\frac{1}{8} x_{0}[n-1] \\
& y_{1}[n]=\frac{1}{4} y_{1}[n-1]+\frac{1}{12} x_{1}[n]
\end{aligned}
$$

and $v[n]=a v[n-1]+b x[n]+c x[n-1]$. Determine $a, b$, and $c$.
6. (40 pts) Given a causal LTI system with the system function: $H(z)=\frac{1-2 z^{-1}}{1-0.75 z^{-1}}$,
(a) Determine the difference equation that is satisfied by the input $x[n]$ and the output $y[n]$.
(b) If the input to this system is $x[n]=5^{n} u[n]+20^{n} u[-n-1]$, write a Matlab script 'q6.m' to recursively calculate the numerical values of $y[n]$, based on the difference equation obtained in (a), where $n$ goes from 0 to 30 , and $y[0]=0$.
(c) Attach the source code 'q6.m' in the PDF file 'hw3.pdf'. Also submit 'q6.m' separately on Canvas.
(d) Show and attach the stem plot of $y[n]$, where $n$ goes from 0 to 30 .
(e) What is the numerical value of $y[30]$ ?
